Pipeline theft is the latest major threat to Mexico's battered oil industry

CHRISTOPHER WOODY MARKETS FEB. 6, 2016, 10:51 PM

Mexican oil prices fell after a brief rally earlier this week, slipping to \$24.47 a barrel on Tuesday and prolonging the slide of one of the country's most lucrative exports.

In addition to the continuing downstream pain — or the brutally low prices oil is being sold for on the market — Mexico's oil industry is dealing with a severe theft problem preventing an increasing amount of its production from ever getting to market.

Pipeline theft in Mexico rose 52% in 2015 according to an Associated Press report, a spike that comes after a 43.7% annual increase recorded in 2014.

The number of illegal taps has risen from 132 in 2001 to 3,348 in 2014.

San Jose: Latest airport fence breach renews focus on persistent problem

By Eric Kurhi and Mark Gomez Staff writers

POSTED: 8:05:39 PM PDT UPDATED: ABOUT A YEAR AGO

SAN JOSE -- Nearly a year after a high-profile security breach at Mineta San Jose International Airport, little seems to have been done to bolster what has proven to be a repeatedly exposed vulnerability: 6 miles of perimeter fence that doesn't do its job of keeping people out.

Mumbai: Frequent intrusions worry airport security officials

By Neha LM Tripathi | Posted 12-Jun-2015

Five cases of security breaches have been reported at the city airport in the past 6 months, where people have been able to sneak into the premises either by submitting a forged ticket or by scaling the outer perimeter walls

BG·OPTICS

What is the problem?

Can you sense
your facility?

- Wide functionality range – warning, detection, identification, tracking
- Broad application range – from data providers to top level security installations
- Any type of installation – underground, fence, wall, pipeline
- In-house R&D – highly customizable
- Full production cycle from idea to hardware and software implementation
- Extensively tested in the world's harshest conditions
- The latest detection algorithm
- Self-learning and self-healing design
- Complete integration with any means of secondary detection, such Video, Radar, etc

Typical WOLF hardware configuration

Multiple types of key infrastructure assets and facilities have unique requirements. For example:

FENCED INSTALLATIONS

- Early warning
- Fence intrusion
- Intruder tracking
- Robust to deception tactics
- Complete site monitoring

PIPELINES

- Tap in activities prevention
- Terrorist attach prevention
- Reliable remote monitoring
- Underground, overhead pipelines

LONG-DISTANCE INFRASTRUCTURE

- Railway and data communication lines
- Train localisation
- Border security
- Human and animal movement

comprehensive security
sensing

 **WOLF-U**

Underground buried sensing

Detection of ground activity – footsteps,
animals, vehicles, digging, excavation

Learning mechanism

Best for pipelines, border, railways,
vicinity warning

 **WOLF-S**

Fence-mount PIDS

Features – detection of intrusion, fence
cut, climb, ladder, tempering

Immune to wind, rain, hail, trains, other
nuisance triggers

Best for fenced installations

 **WOLF-W**

Wall-mount PIDS

High precision wall activity sensor

Detection of climbs and break-ins

Best for walled up top security
installations

 **WOLF-T**

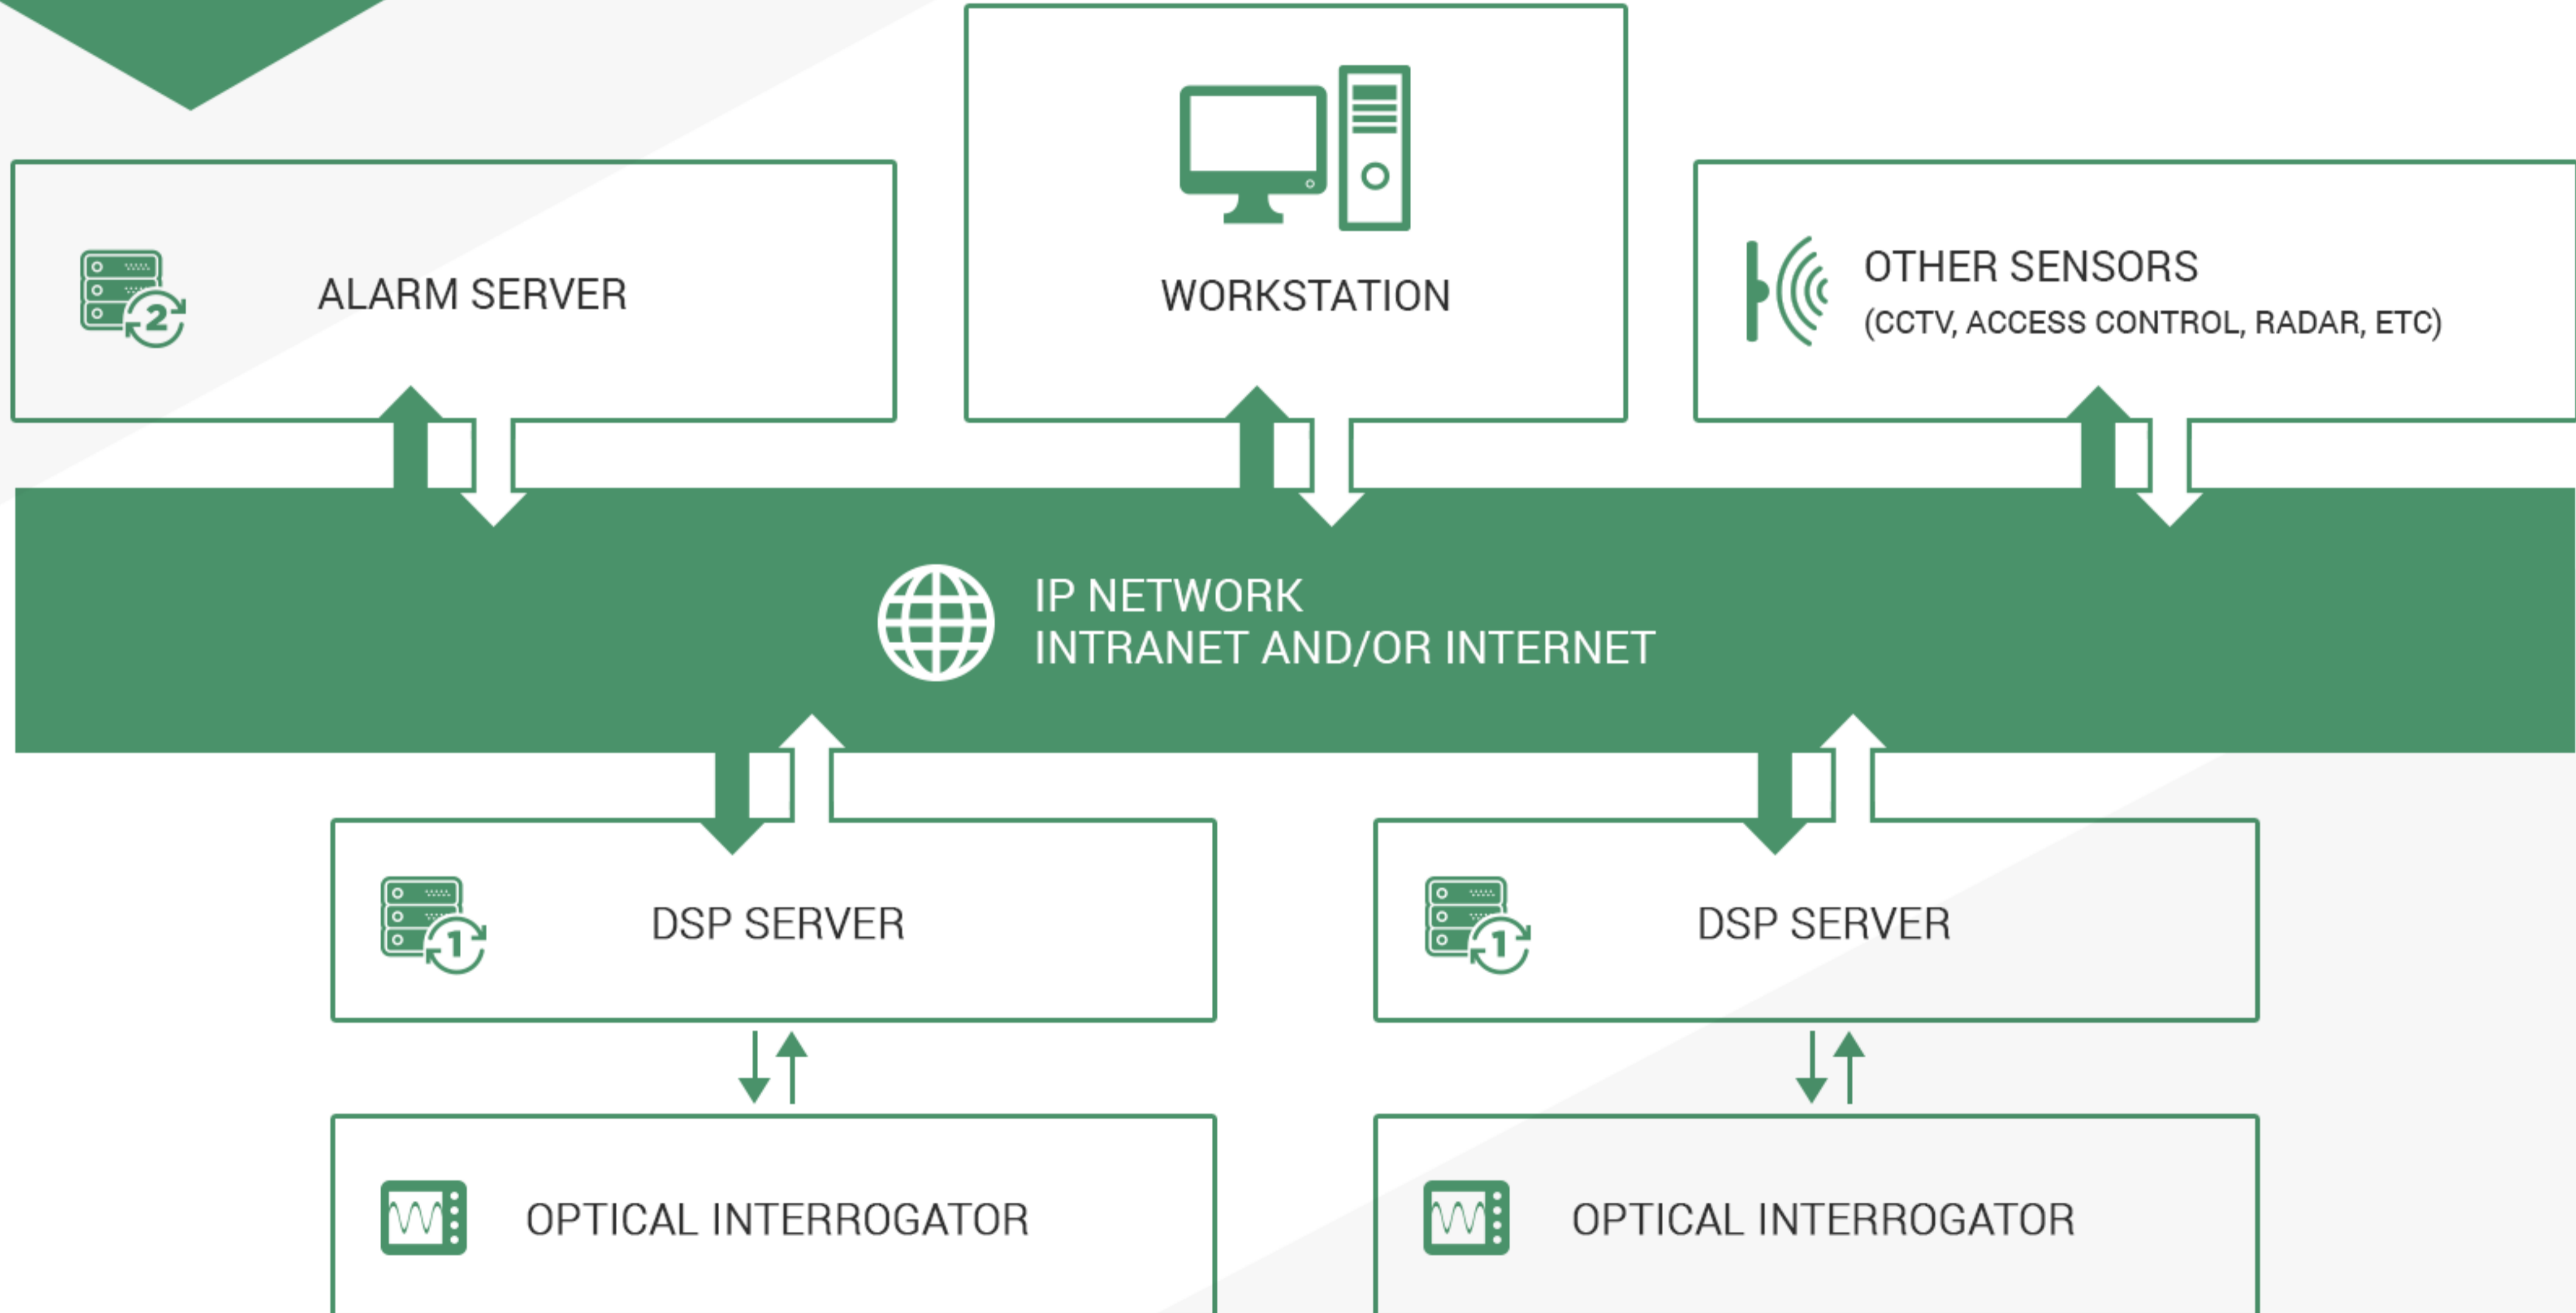

Intruder 1D, 1D-directional, and 2D tracking

High-accuracy tracking

On foot and vehicle identification

Best for key installation where security
or safety is top priority

Inexpensive.</p> |

Good security installation will always have two independent security alarm systems integrated at decision making level – one of them is typically CCTV for visibility, while the other provides sensitivity.

BG-OPTICS

WOLF – fenced installations protection

- The most complete solution on the market
- High probability of detection
- Low false alarm rate
- Cut immunity
- Multiple target detection and tracking
- Layered protection:
 - Warning layer – before perimeter, monitors intruder approach
 - Fence layer – on perimeter, detects intrusion
 - Tracking layer – intruder movement inside
- Provides complete security solution against all types of intrusion: on foot, in vehicles, underground
- Simple and quick installation and repair
- Unlimited perimeter length
- One sensor cable can detect and track simultaneously
- Multi-site capability
- Integration with new or existing systems (e.g. CCTV, etc)

BG-OPTICS

Pipeline protection – options

1

Parametric pipeline condition monitoring system

Currently parametric control systems is the main pipeline condition monitoring technology used

- + no new equipment required

2

Infrasound Monitoring System

Infrasound sonar antennas are used as sensors responsible to measure the pressure inside the pipeline wave

- + long distance between sonar antennas (up to 50km)
- + high sensitivity (leaks up to 0.5m³/h) and high spatial accuracy (up to 50m)

3

Distributed Fiber Optic Temperature Sensing

A fiber optical cable placed at some distance away from the pipeline is used as a sensing element. The principle of operation of such systems is based on measuring the temperature change around the cable

- + long controlled distance using one sensing unit (up to 30km)
- + high spatial accuracy (up to 5m)

4

Distributed Acoustic Fiber Optic Sensing

A fiber optical cable placed at some distance away from the pipeline is used as a sensing element. The principle of operation of such systems is based on measuring the acoustic vibrations around the cable

- + long controlled distance using one sensing unit (up to 100km)
- + high spatial accuracy (up to 10m)

- Multiplexed sensors
- Distributed sensor/s – to detect external activity
- Network of discreet sensors – to detect leakage and tap-ins
- Digging, excavation, tap-ins, illegal trespassing, leaks
- A network of signal processing servers integrated with alarm forming servers at control center
- Unlimited pipeline length
- One site for signal processing can cover up to 100 km of pipeline length
- Sensor cable can be used for high-speed data
- Highly scalable

WOLF – long distance installations protection

- High probability of detection
- Learning algorithms to minimize false alarms
- Integration with CCTV
- Highly customizable
- Detection of:
 - Perimeter intrusion (if available)
 - Walking humans and animals (with modified surface)
 - Movement of vehicles and machinery
 - Digging near the railway tracks – prevention of terrorist attacks
 - Train localization
- Provides complete security solution against all types of intrusion: on foot, in vehicles, underground
- Simple and quick installation and repair
- Unlimited rail length – all alarms are aggregated in operation control center and disseminated to local authorities

BG-OPTICS

WOLF – underwater protection

Cable layout and detected activities types

500 m

Surface vessels

100 m

Motor boats

Cargo drop
(when hitting the ground)

Submarine work

10 m

Diver in tow

Only one optic fiber core is required for the system operation

- Detection of:
 - Divers tempering with infrastructure
 - Divers in tow
 - Motor boats
 - Surface vessels
 - Cargo drops
- Long distance of up to 40km
- Can be embedded with power or data cables
- Completely passive system

BG·OPTICS

WOLF features

100 m

Up to 50km of continuous line sensing. Up to 100km of straight line monitoring per server installation

Detection of: walking, hand shovel digging, excavation, continuous track vehicles, cars, trucks, 1D, 1D-directional and 2D tracking, structural deformation, underwater trespassing

Resistance to environmental conditions: EMI, RFI, rain, hail, lightning, etc

Fast response time – less than 0.5 sec

Dynamic adjustment to environmental conditions

Standardized sensor cable – off-the-shelf equipment brings total life-cycle cost down

Typical Trade-off

Ideal System Performance

BG-OPTICS

WOLF – underwater protection

Completely passive on-site system – no active elements in sensing network

Used software of the logic Installation simplicity

One time configuration

Zero on-site maintenance. All minimized maintenance to be done in server room

Remote alarm monitoring from tablets and mobile phones on iOS and Android

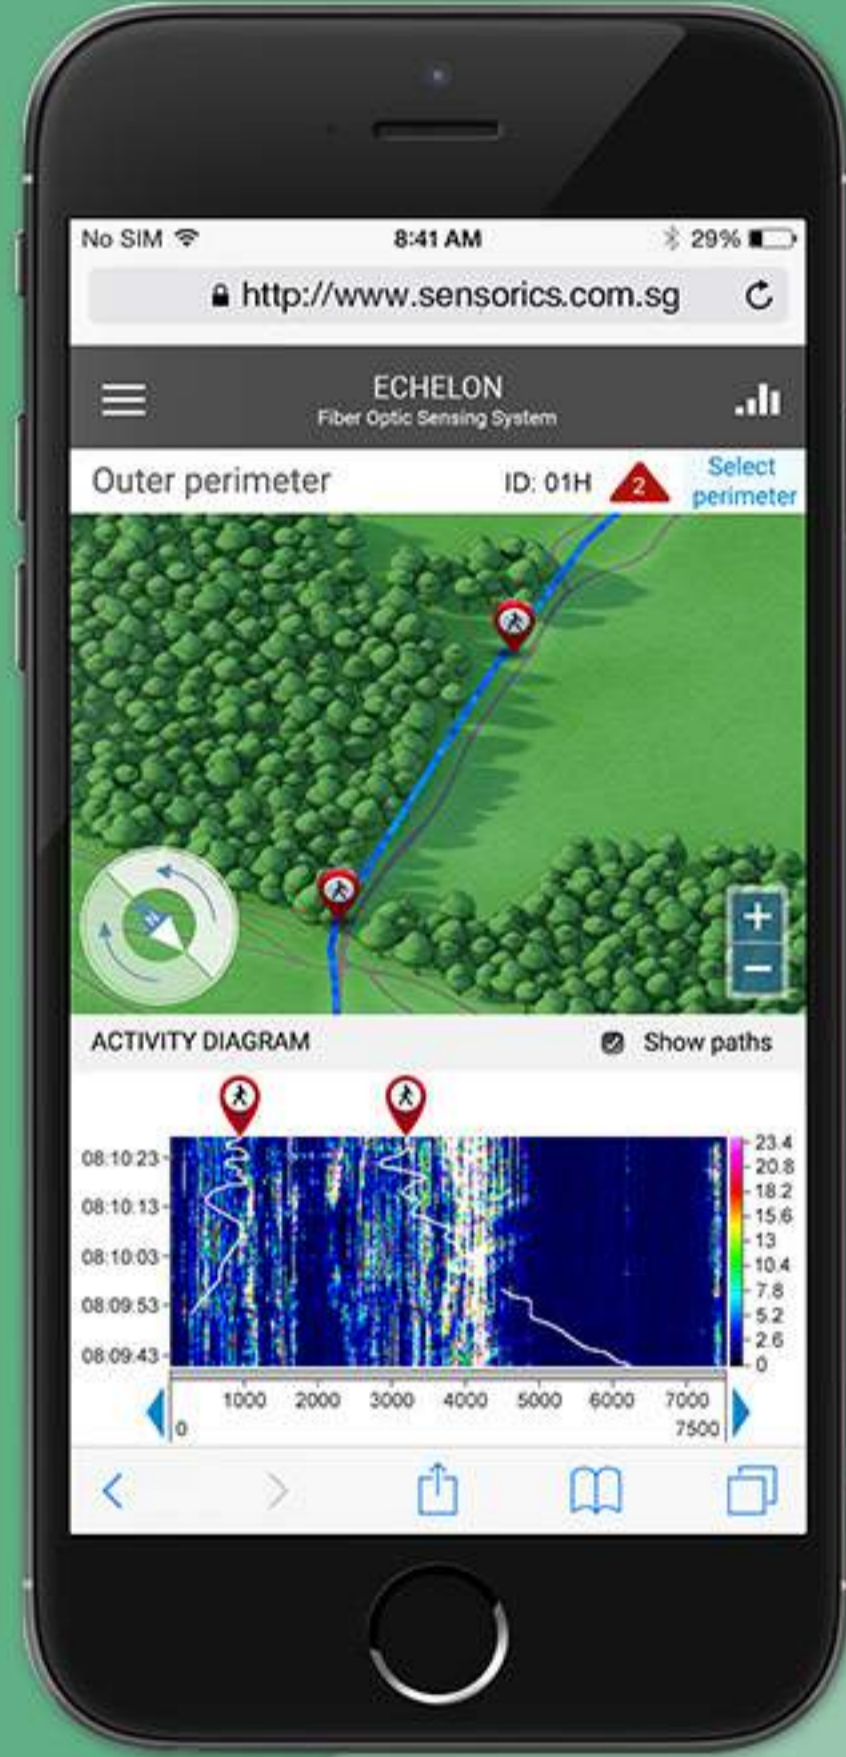

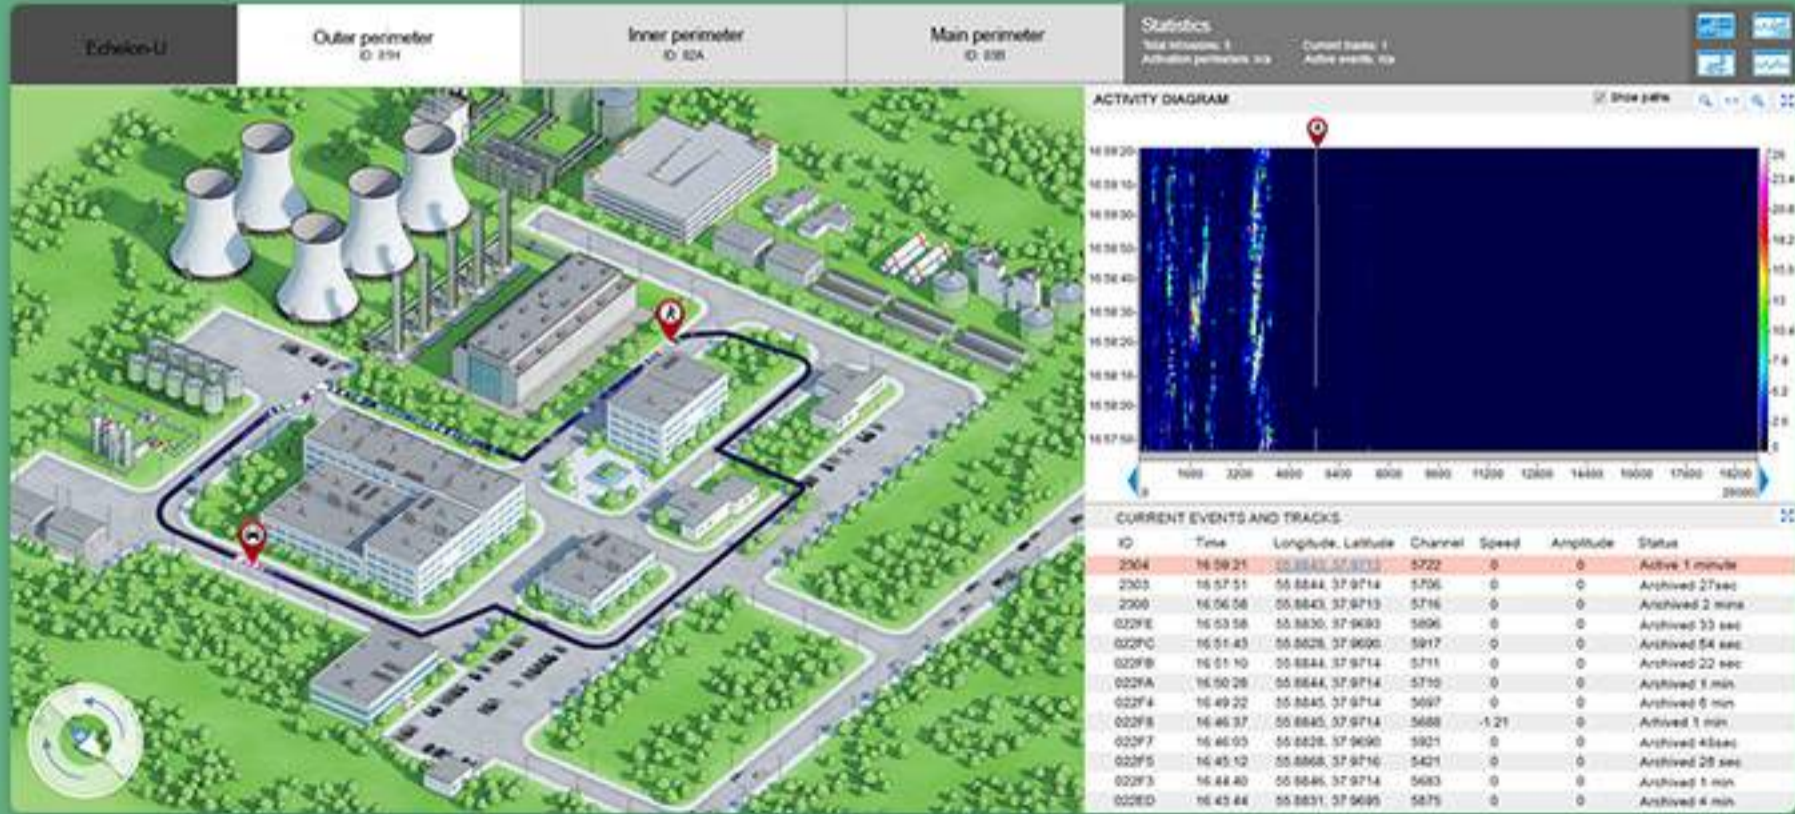

Pin-point accuracy perpetrator detection – +/-5m

Proprietary signal processing and alarm forming algorithms that allow to maintain high Probability of Detection while reducing the Probability of False Alarm without reduction in Sensor Sensitivity Level

Minimized system setup during commissioning

Wide range of visualization options:

Geographical localization based on new or existing maps

Indication of alarms, target types, etc

Full history log

Dedicated screens for operator, maintenance crew, and engineering support team

Option for mobile devices to connect

BG·OPTICS

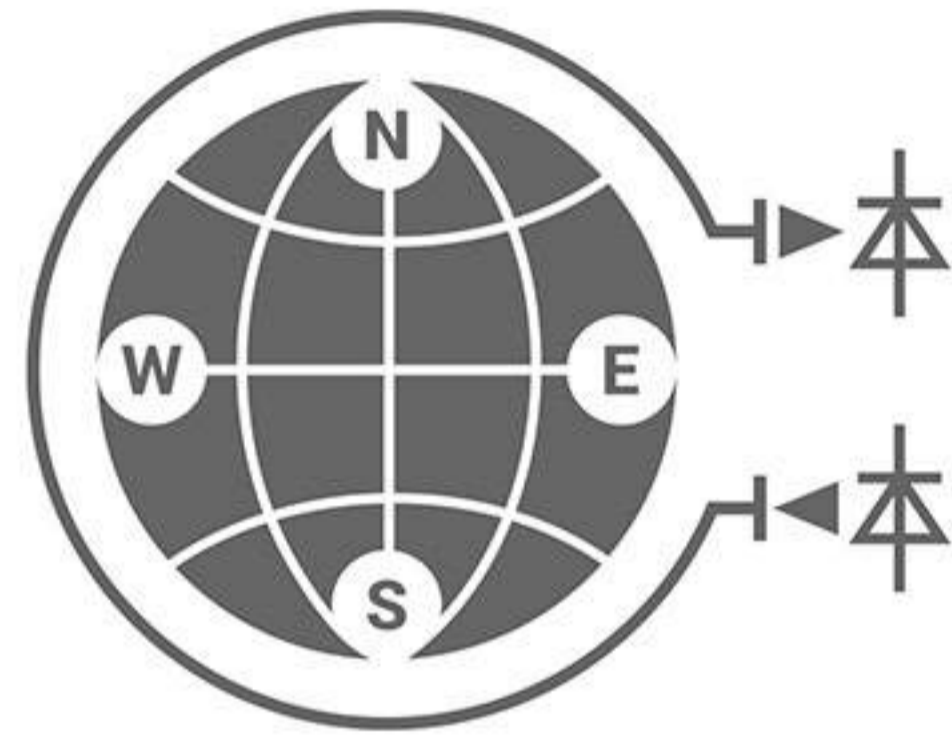

WOLF installation

In contrast to existing security systems, WOLF does not require complicated construction and installation work. The thickness of the soil layer required for the installation of the system is from 0.3 to 0.7 m. The cable is simply placed inside the trench and covered with soil.

The usual procedure for installing the system is the following:

- Integration and installation of the system logic module together with the operator's console;
- cabling and connection of the fiber-optic cable-sensor;
- binding the distance channels of the cable-sensor to the geographical coordinates;
- in the case of accidental or intentional damage to the cable-sensor, repair is performed by welding the ends of the sensor using standard equipment and can be lengthen, if necessary.

BG·OPTICS
